

### Disabling multi-factor authentication for your login

If your firm has made multi-factor authentication optional (rather than required), you can disable it for your own login.

**Note:** If you have an active temporary code in place for your account, disconnecting your paired mobile device does not automatically disable multi-factor authentication. You will continue to use the temporary code until it expires. For details, see [Generating a numerical code for temporary login](#).

1. Navigate to the NetFirm CS login screen and enter your login credentials.
2. Click your name near the upper-right corner of the screen and choose [Manage Multi-factor Authentication](#).
3. Click the **Remove** link to remove a multi-factor authentication method.

**Note:** If multi-factor authentication is **required** for your login and you remove your only authentication method, you will need to add a new method or use temporary login codes to access your account.

4. Click Enter.
